

# IDENTIFY

## Punch barcode reading for easy identification

### IDENTIFY

I Holland understand the need for validation and process control during tablet production. Inadequate process control can lead to incorrect product and lost productivity. IDENTIFY provides a secure alternative to the human eye in tooling identification, particularly when the differences in punch tip specifications are minor.

#### The Marking

IDENTIFY marking is a new system from I Holland designed to ensure that each punch & die match a control tool prior to loading into the press. This helps to reduce the risk of producing rogue tablets within a batch and possibly also damage to the tools and tablet press. The tools are marked during production at our factory with a unique DPM laser etching. We can even mark your existing tools.

#### The Reader

The IDENTIFY reader is simple to use with cordless one-handed trigger operation. Only correctly DPM coded tooling will be accepted. The unit provides clear go/no-go indications with both visual and audio signals - leaving the operator in no doubt. The device is fully transportable, enabling tooling to be validated in storage areas, tooling rooms or even next to the tablet press.
