

I Holland's Wear Indicator Layer

Do you know when your coating has reached the end of its cycle?

Many of our customers that use coatings ask us;
'When do we know our coating is wearing out?'

I Holland have the answer! I Holland's wear indicator layer is a distinctive gold coloured layer that is revealed as the functional coating nears the end of working life cycle.

Wear around the tip face specifically can cause issues such as sticking and picking. The wear indicator layer provides an indication and solution to prevent any long term damage to the press and delays in production due to increased cleaning and/or unforeseen replacement of tooling.

Note: Currently available with PharmaCote[®] CN, CN+, CX & CX+ coatings.
